INTRODUCTION

IMAGINE - *Inclusive Market AGriculture In North-west Europe* - is a social innovation project co-funded by the INTERREG North West Europe programme.

It aims to combat youth unemployment by providing employment opportunities in the market gardening sector, specifically for young people (15-34 years old) not in education, employment or training (NEETs) from peri-urban areas of North West Europe.

One of the objectives of this long-term approach is to create a transnational network dealing with social innovation in urban and peri-urban market gardening.

These activities are most often carried out on land made available by local authorities in order to give a new vocation to this abandoned land, which then takes on an economic activity

The Benchmark study aims to identify already existing networks that deal with general social issues and in particular those related to the integration, employment and training of NEETs, the target audience of the IMAGINE project. The comparative analysis of existing networks will enable the IMAGINE project partners to develop the foundations of a European network based around social innovation and integration through market gardening.

This report consists of three main parts:

- ▶ A first part entitled ***“Comparative data analysis”*** which gives an overview of the different networks identified, their specificities, their common points and their singularities.
- ▶ A second part entitled ***“Research grids and identified networks”*** which lists and draws up a statistical portrait of the networks identified in the six countries on which the research sample was focused.
- ▶ A third part entitled ***“Towards a European/international IMAGINE network for sharing experience and know-how”*** which introduces the strategy for the creation and development of the IMAGINE network.

RESEARCH METHODOLOGY

The research of the networks was based on a **“Research Grid”** (detailed in Part 2) that meets the objectives of this assignment.

This grid covers the following information:

- ▶ the scale at which organisations work (international, national, regional, local),
- ▶ the nature of the network (public or private),
- ▶ the target audience (young people, youth and adults, NEETs, disabled people),
- ▶ the type of agricultural activity (agriculture (in the general sense), urban/peri-urban market gardening, horticulture, other activities involving the cultivation of land),
- ▶ the objective of the network,
- ▶ the mode of operation (training, employment integration, sale of products, etc.).

The geographical coverage of the research is north-western Europe (Belgium, France, Luxembourg, the Netherlands and the United Kingdom). With regard to the geographical coverage of the networks and in order to provide a com-

plementary comparative element, we have extended the research to two southern European countries: Spain and Italy.

The internet search consisted of cross-referencing keywords, framing the objective of the country search. In order to adjust the research to the objectives of the mission, the selected networks all include:

- ▶ As their objective: the social integration of people in difficulty, excluded from society.
- ▶ As their target audience: young people.
- ▶ As their activity: market gardening, horticulture.

This study was intended to be as comprehensive as possible. Nevertheless, it is possible that some activities could not be detected due to the lack of visibility on the Internet or the maintenance conditions of some websites.

It should also be noted that as this study was conducted at a certain point in time, it is possible that these organisations have reorganised their activities since then.

NUMBER OF WEBSITES IDENTIFIED BY COUNTRY

Belgium	Spain	France	Italy	Luxembourg	The Netherlands	United Kingdom
24	30	38	30	5	5	16

The number of networks identified is very uneven across the 7 target countries. This implies a nuanced look at the comparative interpretation of the data. In particular with regard to the Netherlands and Luxembourg.

PART 1: COMPARATIVE DATA ANALYSIS

In order to make a comparative analysis between the different networks identified, we built a research (or data collection) grid with the main information contained in the web pages of each of the identified network sites. The analysis shows the common points and specificities between the seven selected countries, comparing the respective objectives, mode of operation, nature of the network, target audiences, geographical coverage and legal status.

With regard to the search for networks in the Netherlands and Luxembourg, it is important to note the difficulty in identifying an equivalent number of websites in the other five countries. We can interpret the low number of sites identified as a language 'barrier' to the choice of keywords for the search. Simultaneous translation is not always effective (see also conclusion).

The 4 networks in the Netherlands were identified and provided to us by our project partner IMAGINE Phood Farm in the Netherlands.

A. Objectives of the networks

The objective of social integration is to give people who have left the educational, socio-professional and other systems the necessary keys to build a life project. The circumstances that lead to social exclusion are fundamentally linked to deficiencies in the area of:

- ▶ Emotions (relationships/family)
- ▶ Training, education/culture, adherence to collective and social values,
- ▶ Health (physical, mental)
- ▶ Intellect and skill
- ▶ Economic resources (functional/productive)

As a result, **the objectives of all the selected networks** address these shortcomings in one way or another.

Before entering into the comparative analysis of the data, it is important to clarify what is meant by "Network".

The list of "**Networks**" identified in the data analysis grid, contains **names of networks** that group together a set of local projects or initiatives and a sharing of information useful for the network's objectives. However, this list also contains **names of projects** that are in themselves "small networks" and that provide the Benchmark with an interesting insight into the diversity of approaches to social innovations in urban and peri-urban market gardening in the seven selected countries.

On the other hand, this nuance between "network" and "project or initiative" is not always clearly identified in every website visited.

The information in the "objectives" column is described in more detail in the "research grid", in order to be faithful to the information provided by the network.

Therefore, in order to simplify the analysis of the objectives, we have summarised this detailed information in three major objectives:

- ▶ **Socio-professional objectives:** to bridge the training gap and facilitate integration into the labour market.
- ▶ **Therapeutic objectives:** to improve the consequences of exclusion due to health/disability issues.
- ▶ **Environmental objectives:** to participate in the protection of the environment (*)

(*) We have differentiated between networks whose objectives clearly show an awareness of and contribution to environmental protection and those networks whose objective is socio-professional while working in accordance with environmental and climate objectives.

B. Operation of the networks - type of legal structure

1. Shared elements

In the context of the operation of all the networks, two points are shared by all:

1. support for social and professional integration, through learning an activity related to working the land and respecting the environment;
2. the creation of social bonds.

The integration of this target audience will be achieved through the acquisition of a first professional experience, training, participation in specific projects/programmes of agricultural activities (production and sale of products), with support.

Most of the networks operate in an associative form with socio-professional integration programmes carried out at local, national and, to a lesser extent, European level.

2. Country specificities

a. France

France had 3,843 economic integration organisations (SIAEs) at the end of 2019. These specialised organisations, such as 1,907 integration workshops and sites (ACIs), 655 intermediary associations (AIs), 981 integration companies (EIs) and 300 temporary work integration companies (ETTIs), sign agreements with the State which usually allow them to receive and support these workers.

Intermediary associations allow people with particular social and professional difficulties to work occasionally for users.

Integrations workshops and sites offer a professional activity to unemployed people who have difficulties with social and professional integration.

Integration companies operate in the commercial sector with a social objective and offer people in difficulty a productive activity with services.

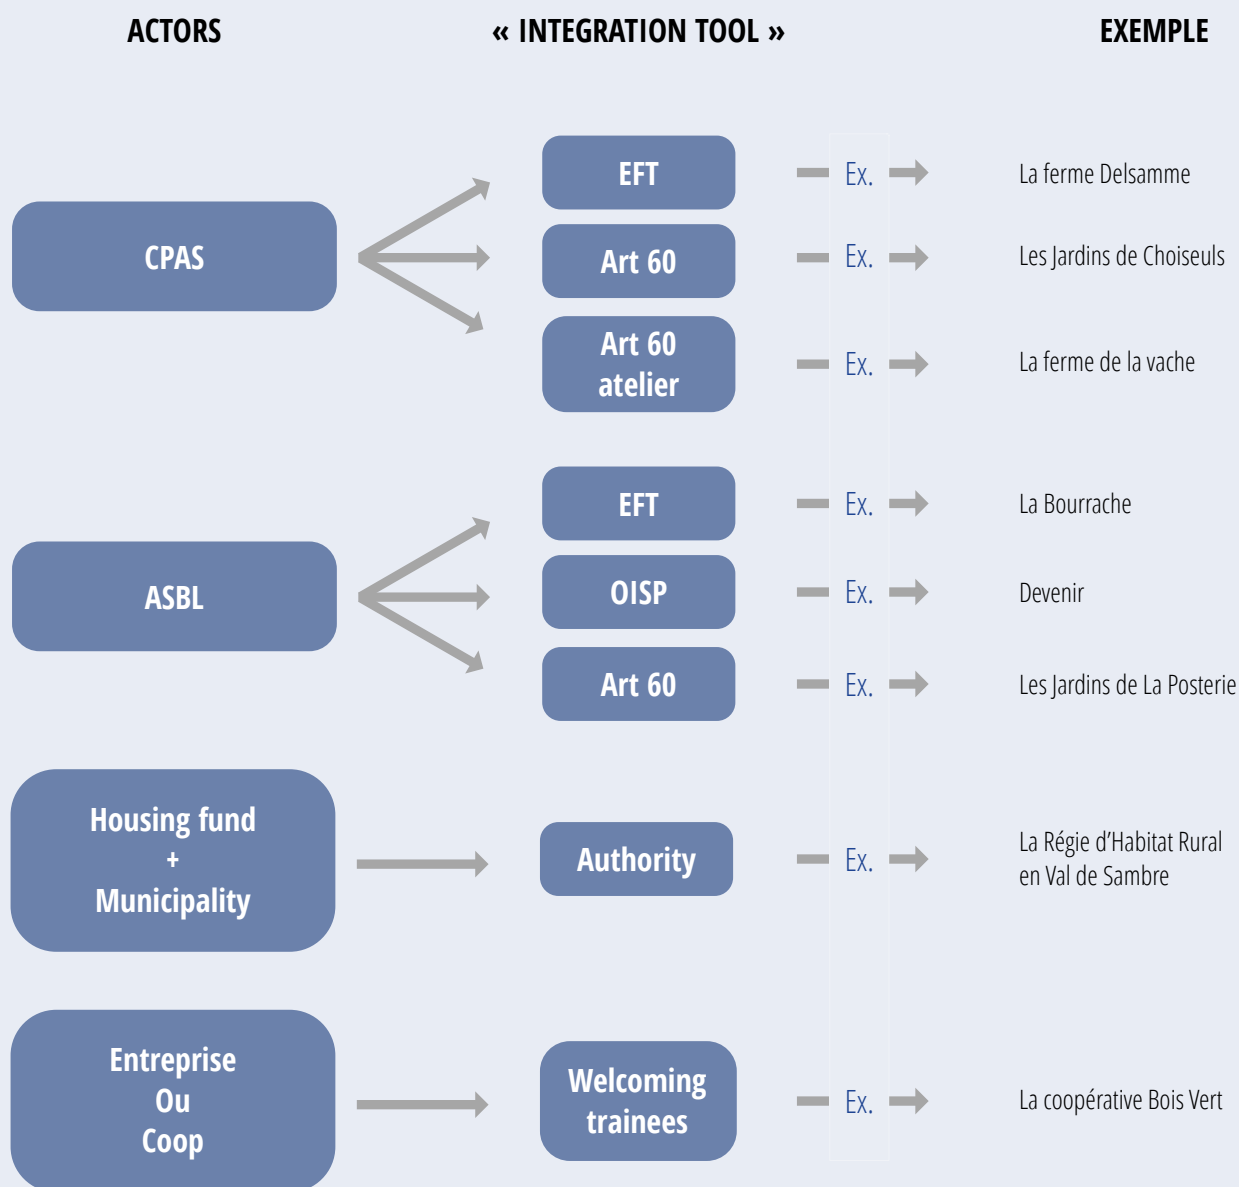

Temporary work integration companies are a temporary work companies whose activity is focused on professional integration.

Self-employment integration companies (EITI) enables unemployed people with particular social and professional difficulties to carry out a professional activity by benefiting from a service that puts them in touch with customers and provides them with support.

- ▶ 87% of the networks operate in the form of an association, of which more than 50% work with economic integration structures (ACI "integration workshops and sites").
- ▶ 10% of the networks operate as a Foundation.
- ▶ Few private companies were identified with a professional integration project.

b. Belgium

The diagram below shows the actors and legal tools used by the socio-professional integration organisations with agricultural activities (market gardening, horticulture, etc.)

▶ **CPAS (24% of networks/projects)**

Centres publics d'action sociale (public centres for social welfare) are public bodies whose mission is to "enable [everyone] to lead a life in accordance with human dignity". They are therefore responsible for providing social assistance to certain people, but other specific psychological, social, financial, medical and administrative support measures are provided to enable them to reintegrate into an active social life.

▶ **ASBL: association sans but lucratif [non-profit associations] (60% of the networks/projects identified)**

Non-profit associations in **Belgium and Luxembourg** can be governed under public law (e.g. founded by a municipality or other official bodies) or under private law, which does not prevent it from being for public benefit.

▶ **EFT**

Entreprises de Formation par le Travail, or on-the-job training companies, are associations whose purpose is to train trainees using an educational method based on the performance of productive work, accompanied by theoretical training adapted to individual needs, as well as psycho-social support.

▶ **OISP**

The aim of the Organismes d'Insertion socio-professionnelle (socio-Professional integration organisations) is to give more opportunities to low-skilled job seekers. They offer a range of training courses in many fields and professions.

▶ **Article 60**

Article 60 contracts are employment contracts concluded between the CPAS and a beneficiary of its services. Employment in accordance with these articles is a form of social assistance that allows a CPAS to provide employment to a person who has never entered or has moved away from the labour market.

▶ 12% of identified networks/projects are co-operatives/enterprises

c. Luxembourg

Of the 5 networks/projects identified, 4 are ASBL associations, and the last one is a state body: ADEM - Agence pour le développement de l'emploi [Agency for Employment Development].

d. United Kingdom

Of the 16 Networks identified:

- ▶ 69% are "charities", charitable associations ("associations d'utilité publique", or public utility associations, in France).
- ▶ 31% are legal structures in the form of a Trust.

In the United Kingdom, charitable status is a legal and financial privilege granted by Parliament.

e. The Netherlands

Of the 4 networks identified, all are private structures with financial and organisational support from municipalities, 2 of which are associations and 2 are foundations.

It is important to note that the Netherlands is developing numerous urban agriculture projects with the main aim of developing healthy and sustainable food on a national scale. The *Stadslandbouw* Nederland* network brings together urban agriculture projects on a national scale. It shares knowledge and makes connections between people and issues such as health, society and climate adaptation. It is a knowledge platform.

The platform brings together several urban agriculture projects in different regions such as Amsterdam (*Van Amsterdamse Bodem*), The Hague (*Stadslandbouw den Haag*) and Rotterdam, ..

(* Urban agriculture

On a regional scale, the municipality of Amsterdam (*Stadslandbouw Amsterdam*) supports its residents and entrepreneurs in the development of urban agriculture in the Amsterdam metropolitan area.

These platforms present themselves as associations (or foundations) in collaboration with municipalities and other public and private partners.

The City of Amsterdam offers a map of urban agriculture projects (vegetable garden, vertical agriculture, utility garden, food cooperative, etc.). More than a hundred projects have been created or are being created.

f. Italy

Of the 30 networks surveyed, we identified four types of operating structure:

- ▶ Non-profit social associations: 43%
- ▶ Agricultural cooperatives: 27%
- ▶ Agricultural companies (economic and social): 27%
- ▶ Foundations: 3%

g. Spain

In Spain, all the identified integration projects are developed through several types of structures.

- ▶ Non-profit associations: 50%.
- ▶ Foundations (National or International like Caritas): 37%.
- ▶ Social enterprise: 6%.
- ▶ A social enterprise is a form of company that seeks to make a profit by finding solutions to social, cultural and environmental problems, outside the traditional joint venture management approach.
- ▶ State training centres: 6%.

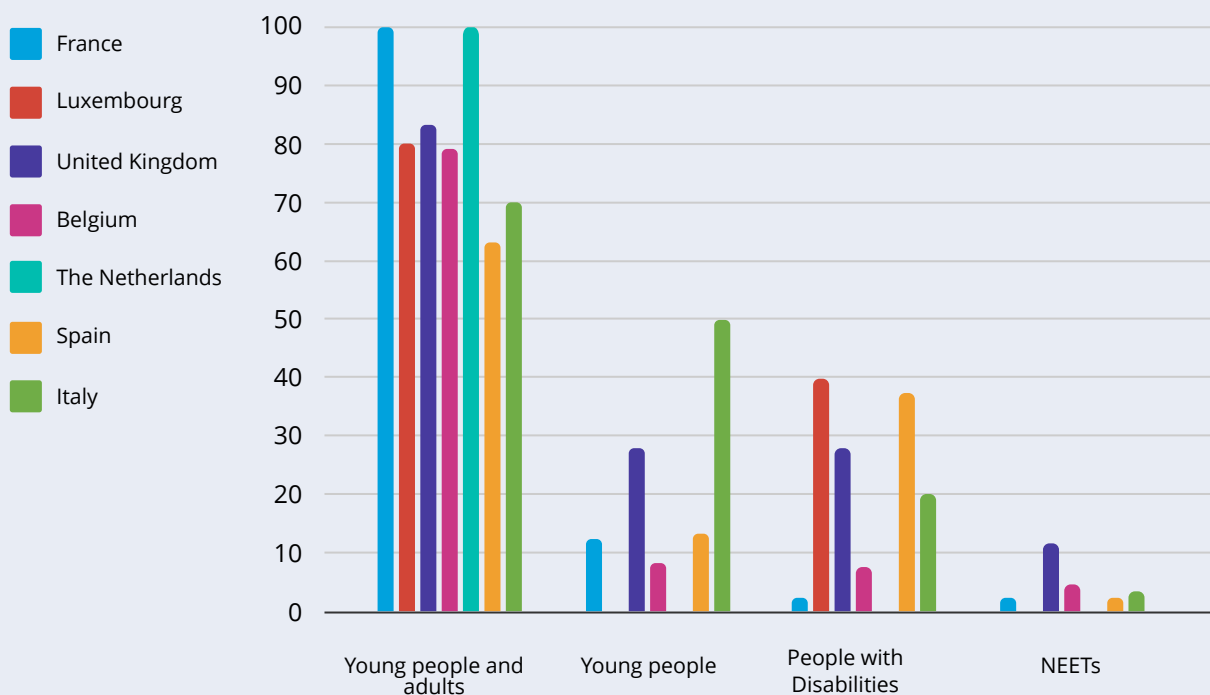

In all the countries covered, more than 50% of the socio-professional integration projects through agriculture are attached to associations.

Other legal forms appear at different percentages depending on the country: i.e. Foundations, Cooperatives, Trusts, etc.

C. Target audience - Age group

The research methodology was open to all age groups, targeting people with very serious social and professional integration difficulties.

Distribution of target audiences according to the organisations identified by country *(graphical representation of the data in the table on page 17)*

1. Shared elements

Socio-professional integration projects linked to earthworking activities are mainly aimed at **a wide range of ages, young people and adults**, the objective being to integrate as many people as possible.

The “young people” group concerns networks with projects exclusively aimed at young people, generally in the 16-35 age group.

In the “research grid”, the term NEETs used to identify the target audience of the project is not exclusive. This term originated in the United Kingdom (UK) and is therefore more commonly used to define the characteristics of the target audience.

2. Country specificities

Italy stands out in terms of the number of projects exclusively for young people.

In the data entry methodology, it should be noted that the "Target audience" data corresponds to a multiple choice. For example, in the "young people and adult" and exclusively "young people" groups, some networks emphasise the inclusion of people with disabilities.

This inclusion is more significant in the networks in Spain, Italy and Luxembourg.

The "disabled" group concerns projects mainly dedicated to people in vulnerable situations and

at risk of exclusion due to psychological, intellectual or physical health problems.

For Luxembourg and the Netherlands, it should be remembered that the reading may be biased by the difference between the number of networks identified: 5 for Luxembourg, 4 for the Netherlands, and 30 for Italy and Spain.

It is also in these two countries (Italy and Spain) that the integration of migrants and asylum seekers is the most significant, especially in the geographical regions most affected by the reception of these populations.

D. Type of agricultural activities

The study specifically targets urban and peri-urban market gardening activities. In order not to "sideline" a specific project in this field, we have extended the scope of the research to include agriculture-related projects.

In the search for networks, when we cross-reference market gardening activity with socio-professional integration projects, we automatically obtain projects on **urban and peri-urban market gardening** activities, as this socio-geographical area is more affected by the integration issue.

An urban area is located within the city and a peri-urban area is under the influence of the city, especially with regard to mobility issues (home/work).

As the surface area of the 7 countries is very different (France 643,801 km² versus Luxembourg 2,586 km²) the notion of a peri-urban area is not the same.

In order to respond to the purpose of the study "to develop the foundations of a European network around social innovation and integration through market gardening", we have sorted the networks by selecting all those that propose urban and peri-urban agriculture projects and indicating

(multiple choice) those that offer market gardening activities.

Within urban and peri-urban agriculture, the various projects offer different production techniques (market gardening, horticulture, arboriculture, etc.). The definition of market gardening is an important consideration in the research results.

As such, while the dictionary of the Académie Française defines market gardening as the "cultivation of vegetables in gardens, often near large cities", the Larousse dictionary defines it as the "intensive cultivation of vegetables in the open air or under cover".

The definition of horticulture also varies according to the sources of information.

Horticulture includes all activities related to the garden (hortus) or the art of cultivating gardens, growing vegetables, flowers, fruit and ornamental trees and shrubs.

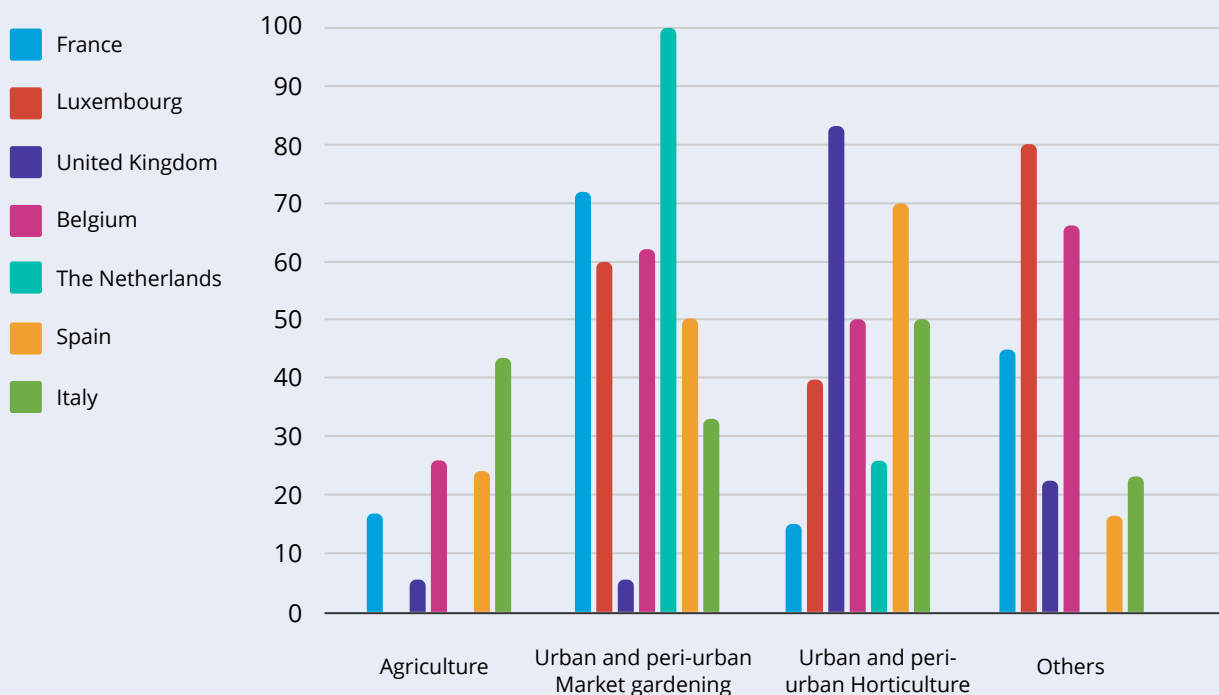

Other definitions equate horticulture with market gardening.

This diversity of definitions within a single country is also a finding between the various coun-

tries in the study. The two indicators for market gardening and horticulture in the research grid should be interpreted with this in mind.

The “other” column includes other types of production related to working the land, mainly gardening and maintenance of green spaces.

Distribution of target audiences according to the organisations identified by country *(graphical representation of the data in the table on page 17)*

1. Shared elements

The selection of urban and peri-urban projects excludes conventional agricultural projects, which are mostly developed in rural areas. Most of the integration projects use market gardening and horticultural techniques.

The “other” column is very often represented by gardening and maintenance projects for public green spaces.

2. Country specificities

The United Kingdom shows a specificity in being the country that leads in projects integrating horticulture as an integration activity while it has few market gardening projects.

This may be due to the definition of horticulture in the UK: *"Horticulture includes a wide range of crops namely, fruits, vegetables, tuber crops, flowers, medicinal and aromatic plants, mushroom, plantation crops, and spices, etc."*

E. Summary

The **number of networks identified** varies greatly: from four in the Netherlands to more than thirty in France.

The identification of 5 networks in Luxembourg and 4 in the Netherlands raises questions.

Having used the same research methodology, this may be due to the reality of existing networks, but also to a "keyword" research methodology not adapted to these two countries, where several languages coexist: in Luxembourg, French, German and the national language, Luxembourgish; in the Netherlands, Dutch, English and even French.

All the selected networks have social integration through land work in common.

The socio-professional objective is shared by all networks, with the therapeutic field and the contribution to environmental protection added to the objectives in some networks.

In Spain and the UK, 50% of the projects use agricultural practices as a therapeutic rehabilitation and integration programme.

Migrants and/or asylum seekers appear to be more clearly identified as a target audience in the projects in Spain and Italy. These two countries are affected by this problem in the first place.

In the UK, we can equate market gardening with agriculture.

All the countries included in the study do not reduce agricultural production techniques to market gardening/horticulture. Only Spain does not seem to diversify techniques.

The Netherlands, which often has nutritional objectives, focuses its projects on urban and peri-urban market gardening.

Generally speaking, in all the countries covered, **the age groups** with access to the projects are flexible. The information given on this subject on the sites is often indicative and in some cases this information is not reported because all ages are targeted.

All the countries included in the study do not reduce agricultural **production techniques** to market gardening/horticulture. Only Spain seems not to diversify techniques.

With regard to the type of project owner, In all the countries covered, more than 50% of the socio-professional integration projects through agriculture are initiatives developed by associations.

It is important to point out that very often this information is "scattered" across all the information on the websites. Understanding the legal structure requires additional research, often outside websites.

Searching on the Internet by keywords very often brings us to "websites" of projects or initiatives.

These projects are mostly carried out by associations, foundations, or other similar structures specific to each country.

These projects **can also be part of a larger network** (e.g. : Jardin de Cocagne in France, or the "Stadslandbouw Nederland" network in the Netherlands with its regional networks "Stadslandbouw Amsterdam", "Stadslandbouw Rotterdam" or the "Groundwork Green Team" network in the United Kingdom with its regional networks (East of England, London, Wales...)).

This grouping of projects under a single network is not always clearly indicated on project websites.

The geographical scale of intervention is similar in all countries. Most of the networks are developing on a national and regional scale with local initiative projects.

ORTI GENERALI

Nature	Geographic coverage	Target Audience	Types of agricultural activities
Private	Local : Torino	Young people and adults	Urban and peri-urban market gardening / Horticulture / Others (Parks et gardens)

Goals

- ▶ Orti Generali offers the opportunity to cultivate in groups, families, associations, or individually; learn with theoretical and practical training courses, activities, and workshops on topics related to organic farming, horticulture, and rural work.

Operating mode

- ▶ Orti Generali is a project of the Association of Chlorophyll Coefficient.
- ▶ A social enterprise model for the transformation and management of residual agricultural areas in the city.
- ▶ There are 150 gardens plus an educational center where you can attend classes.

Contact

- ▶ Strada castello di mirafiori - 38/15 Torino - info@ortigenerali.it - <https://www.ortigenerali.it>

PART 3 : TOWARDS AN EUROPEAN/INTERNATIONAL IMAGINE NETWORK FOR SHARING EXPERIENCE AND KNOW-HOW

A. Introduction to the subject

The analysis of the benchmark shows us a recurrent link between the theme of social integration and market gardening professions (horticulture, agriculture, etc.). There are many common points, both in terms of the legal status of social organisations, but also in terms of the target audiences and the means of implementation.

All the activities identified in the benchmark show that local initiatives for social integration through market gardening, although sometimes very different from one country to another, are still numerous and concern all age groups in the population. As such, we can think that a more global sharing of experiences on a European or even international scale of good practices, implemented strategies and results, could make it possible to widen the field of possibilities.

Consequently, we would like to plan the implementation of a social platform dedicated to exchanges around the main themes of the IMAGINE project, i.e. the social integration of young people (NEETs - not in education, employment or training) through the professions of market gardening, horticulture, urban and peri-urban agriculture, etc. However, we feel it is important not to restrict ourselves strictly to this, but rather, like the organisations involved in social inclusion, to open the way for optimum social integration guidance. For example, other professional fields outside market gardening, which are conducive to social integration and training, the opening up to wider target groups, or social factors such as professional retraining, the integration of people with disabilities or people with an immigrant background, etc.

B. General objective, feasibility, and main principles of the network

The initial objective is to guarantee the establishment of a functional network in the long term, taking into account the control of costs that the network may generate through its development. This is why we are thinking of developing a web platform, which will be animated horizontally: the members of the network will self-animate/co-animate/contribute to the network through their sharing and exchanges. This platform can

be likened to an advanced forum or virtual social network. As such, this leads us to focus initially on the technical maintenance aspects of the autonomous platform.

The idea of creating an IMAGINE network web platform has several advantages which we will develop in four points here.

1. Continuity of digital tools

Setting up a web platform/application of this type is in line with everything that has been digitally built during the IMAGINE project, namely:

- ▶ An independent website, dedicated to the project, for the archiving of project data and its long-term use. It should be noted that the feedback acquired previously by the PALME association through the REGAIN project in particular (INTERREG IVB programming 2008-2014), shows us that a website dedicated to the project created in 2010 has recorded a total of 240,615 visits to date, i.e. an average of 20,000 visits per year over 12 years, thus constituting a medium/long-term impact which is not neutral. This is why we want to put forward the digital tools at our disposal to extend the experience of the IMAGINE project by making the work carried out on the project available in open source. These tools can thus serve as a basis for others, be duplicated, adapted, improved, etc. through field applications in Europe and internationally.
- ▶ An Intranet platform dedicated to the project partners currently ensures regular monitoring of the project, as well as rapid access to a range of information to ensure good control of the project. This platform has many customised modules inspired by project management exchange platforms. In addition, the database of accounts of this platform, composed to date of the IMAGINE project partners, will in fact constitute the main core of the IMAGINE Network users, they will be both the “beta testers” and the first members.
- ▶ An interactive tool allowing any Internet user to be directed to the appropriate documentation produced as part of the IMAGINE project according to their profile. This tool has the advantage of a precise classification of the documents and actions carried out through the IMAGINE programme, and also makes it possible to identify different profiles that may be interested in contributing, duplicating and exchanging on the themes specific to the IMAGINE project.
- ▶ A web application on international mobility, allowing young people from the different countries covered by the IMAGINE project to get information from the organisations in charge of the different international mobility schemes according to their needs, as well as to access a set of useful information.

Consequently, the foundations are already in place to accommodate the creation of this platform, which is clearly part of a more global logic of “leveraging”. The reuse of various previously developed modules and the time spent on them is a major asset. In addition, this platform will also be able to bring together all or part of the various tools mentioned above and will make it possible to maintain an independent post-project IMAGINE presentation, carried by the network members.

As such the IMAGINE website will not remain a simple static showcase over time, but will include a dynamic of expansion through the network, based on sharing.

2. Medium/long-term cost control

It is important to have a clear understanding of the costs of maintaining and managing such a platform over the long term. The PALME association, through its daily mastery of the digital tools that constitute a major part of the services provided to its members and of its activity, can at its level ensure the maintenance of the platform

thanks to its in-house skills, in the same way as it has done for the past 12 years with the REGAIN project already mentioned above. It will continue to manage the hosting of this platform, ensure its proper functioning, as well as any updates that may be required to meet the evolution of technological standards.

3. Medium/long-term cost control

We can also have a clear vision of the next 10 years in terms of the good performance of a web application constituting the *"IMAGINE network"*, the only point of vigilance to be kept in mind concerns its activity and expansion. In the case of a digital network, the only thing we need to ensure, beyond the general good functioning of the platform, is that it can easily adapt to the expansion of the network in the medium/long term. To do this, we will draw on our own experience with the PALME network.

PALME is an international professional network of developers, managers and animators of economic activity areas. This network is composed of about 100 structures based in different French-speaking countries, representing a

sample of about 300 active users. On this basis, for the PALME network we can consider that the server structure must be able to accommodate at least half to two thirds of its members simultaneously. The network must therefore be able to support a sample of 150 to 200 users per day. In the context of the creation of the IMAGINE Network, we believe that this sample provides a good starting point for its operation. Then, depending on the evolution of the network and its members, we will be able to progressively allocate more or less resources as needed. The annual update of the platform could be a good opportunity to take stock of the network's needs in terms of resources.

4. A development that lays the foundation for future prospects

Finally, this progressive development process allows for interesting INTERREG post-project monitoring and will eventually allow for additional developments, or even new avenues of expansion of the network in other forms, through economic development projects carried out by entities. All this is based on needs that may have been previously formulated by the members of the network.

C. Development of the IMAGINE network

Our approach through the creation of the IMAGINE network is freely inspired by those undertaken by the *"circular economy"* networks led by numerous organisations at different levels and scales on the international scene (governments, regions, private companies, etc.).

The objective was therefore to set up an international platform with the aim of creating synergies around the different practices and issues related to the circular economy.

In a similar approach, our IMAGINE network can be developed in three main areas, namely:

- ▶ **Discover** : Accessing the IMAGINE project feedback, the tools and methodologies implemented and the various experiences shared by the network, for information and/or inspiration.
- ▶ **Meet** : Participating in discussions and contributions on social integration practices and policies, build partnerships and integrate project communities.
- ▶ **Accentuate** : Highlighting new experiences that will enhance individual or collective initiatives in the field, bringing visibility to these actions and at the same time enriching the experiences in the network.

D. Development of the IMAGINE network

It seems important to us in the framework of an online platform not to put any brakes on the way of joining and/or contributing, in order to encourage any individual or collective initiative and to enrich the discussions and the contents of the latter as much as possible. This is why this platform will be completely open access. Membership of the platform will be free of charge via a traditional account creation process. It is open to all (citizens, communities, schools, associations, companies, individual entrepreneurs, etc.) and facilitates networking through collaborative spaces.

As such, the platform will allow social innovation project leaders to enrich their experiences with those of the IMAGINE project, to exchange their experiences and to access all existing tools.

As an indication, the platform of the international "circular economy" network created in 2017 has today a community of more than 11,000 members, so in these terms, the objective for the IMAGINE network to have several hundred active members within the next 5 to 10 years seems to us to be quite viable, if only a seed strategy is put in place from the start.

E. What is the membership development strategy for the IMAGINE network?

As mentioned above, our IMAGINE network will consist of a core group of founders (and beta testers) who are none other than the IMAGINE project partners. It goes without saying that each IMAGINE project partner will promote/ sponsor the IMAGINE network to its local partners, whether or not they have been mobilised in the framework of the Interreg project, thus extending the natural reach of the network.

On the other hand, the various events organised in the framework of the IMAGINE project (launch event, webinars, etc.) have allowed us to build a solid base of contacts interested in the approach and results of the Interreg project. These contacts will be informed of the establishment of the IMAGINE network and will therefore be invited to join and contribute to it.

Beyond the IMAGINE project's "close" contacts, the work carried out in this benchmark report has led us to carry out a census of nearly 150 organisations in 7 Western European countries, involved in social inclusion dynamics and thus confronted with daily issues more or less similar to those targeted by the IMAGINE project. This leads us to think that these different public and private actors may therefore be interested:

- ▶ on the one hand, by the results and all the practices carried out through the IMAGINE programme by the various pilots,
- ▶ on the other hand, in joining and contributing to a transnational network for sharing experiences, know-how and life skills in the field of social integration.

As such, an invitation to join the IMAGINE network may be sent to each organisation.
